

Scope Splitting and Cumulativity

Marcelo Ferreira

Universidade de São Paulo

August 14, 2007

Complex Cardinal Quantifiers

- (1) John kissed at least three girls.
- (2) John kissed exactly three girls.
- (3) John kissed fewer than three girls.
- (4) At least four boys kissed at least three girls.
- (5) At most four boys kissed more than eight girls.

Two Theories

(6) John kissed at least three girls.

✓ GQ: $|\{x : \textit{girl}'(x)\} \cap \{x : \textit{kissed}'(j, x)\}| \geq 3$

✓ PL: $\exists X : |X| \geq 3 \wedge \textit{girls}'(X) \wedge \textit{kissed}'(j, X)$

GQ: Barwise and Cooper (1981)

PL: Link (1983) and many others after him

PL looks better

Cumulative Readings

(7) At least four boys kissed at least three girls.

GQ: $|\{x : \text{boy}'(x)\} \cap \{x : x \text{ kissed at least 3 girls}\}| \geq 4$

OR

$|\{x : \text{girl}'(x)\} \cap \{x : \text{at least 4 boys kissed } x\}| \geq 3$

✓ PL: $\exists X \exists Y : |X| \geq 4 \wedge |Y| \geq 3$

$\wedge \text{boys}'(X) \wedge \text{girls}'(Y) \wedge \text{kissed}'(X, Y)$

GQ looks better

Non-Increasing DPs

(8) John kissed exactly three girls.

✓ GQ: $|\{x : \textit{girl}'(x)\} \cap \{x : \textit{kissed}'(j, x)\}| = 3$

‡ PL: $\exists X : |X| = 3 \wedge \textit{girls}'(X) \wedge \textit{kissed}'(j, X)$

Neither looks good

Cumulativity with Non-Increasing DPs

(9) Exactly four boys kissed exactly three girls.

$$\#GQ: |\{x : boy'(x)\} \cap \{x : x \text{ kissed exactly 3 girls}\}| = 4$$

OR

$$|\{x : girl'(x)\} \cap \{x : \text{exactly 4 boys kissed } x\}| = 3$$

$$\#PL: \exists X \exists Y : |X| = 4 \wedge |Y| = 3 \\ \wedge boys'(X) \wedge girls'(Y) \wedge kissed'(X, Y)$$

Fixing PL: Maximality

(10) John kissed exactly three girls.

$$\max\{n : \exists X : |X| = n \wedge \text{girls}'(X) \wedge \text{kissed}'(j, X)\} = 3$$

(11) \llbracket exactly three girls $\rrbracket =$

$$\lambda P. \max\{n : \exists X : |X| = n \wedge \text{girls}'(X) \wedge P(X)\} = 3$$

Fixing PL?: Maximality and Cumulativity

- (12) Exactly three boys kissed exactly two girls.
 $\max\{n : \exists X : |X| = n \wedge \text{boys}'(X) \wedge \max\{n' : \exists Y : |Y| = n' \wedge \text{girls}'(Y) \wedge \text{kissed}'(X, Y)\} = 2\} = 3$

Interim Conclusion

- (13) Exactly three boys kissed exactly two girls.
“The number of **boys who kissed girls** is 3 and the number of **girls kissed by boys** is 2.”

Interim Conclusion

- (13) Exactly three boys kissed exactly two girls.
“The number of **boys who kissed girls** is 3 and the number of **girls kissed by boys** is 2.”
- ▶ When interpreting these sentences, we need access to the relation *boys who kissed girls*.

Interim Conclusion

- (13) Exactly three boys kissed exactly two girls.
“The number of **boys who kissed girls** is 3 and the number of **girls kissed by boys** is 2.”
- ▶ When interpreting these sentences, we need access to the relation *boys who kissed girls*.
 - ▶ The challenge is how to access this relation without violating compositionality.

Previous Proposals: Scha 1981

- ▶ There are binary determiners, such as *exactly3-exactly2* and binary nouns, such as *boys-girls* and binary quantification.
- ▶ Problem: there is no independent evidence for such unorthodox syntax.

Previous Proposals: Krifka 1999; Landman 2000

- ▶ Complex algorithms at the semantics-pragmatics interface that aggregate maximality claims to truth-conditions with the help of alternative semantics.

Previous Proposals: Krifka 1999; Landman 2000

- ▶ Complex algorithms at the semantics-pragmatics interface that aggregate maximality claims to truth-conditions with the help of alternative semantics.
- ▶ My point: There is no need for such radical moves, once we acknowledge that Complex Cardinal DPs have complex internal structures.

The Internal Structure of Cardinal DPs

- ▶ Hackl (2000): complex syntax for complex cardinal DPs

$$(14) \quad \llbracket \text{DP } \emptyset \llbracket \text{DegP exactly 3 } \llbracket \text{Deg}' \text{ Deg } \llbracket \text{NP boys } \rrbracket \rrbracket \rrbracket \rrbracket$$
$$\llbracket \text{boy} \rrbracket = \lambda x. \text{boy}'(x)$$
$$\llbracket \text{Deg} \rrbracket = \lambda P_{\langle et \rangle}. \lambda d. \lambda x. P(x) \ \& \ |x| = d$$
$$\llbracket \text{exactly 3} \rrbracket = \lambda P_{\langle dt \rangle}. \max\{d : P(d)\} = 3$$
$$\llbracket \emptyset \rrbracket = \lambda P_{\langle et \rangle}. \lambda Q_{\langle et \rangle}. \exists x : P(x) \ \& \ Q(x)$$

Degree Operator Movement and Cumulativity

(16) Exactly three boys kissed exactly two girls
[s ex. 3 [$\lambda d'$ [ex. 2 [λd [d' boys kissed d girls]]]]]

- ▶ Not Correct! “3 is the max. n such that n boys kissed exactly 2 girls”
- ▶ Incidentally, this is what Beck and Sauerland (2000:361) propose.

Degree Operator Movement and Cumulativity

(17) Exactly three boys kissed exactly two girls
[_S ex. 3 [_S ex. 2 [_{α} λd [$\lambda d'$ [d' boys kissed d girls]]]]]

- ▶ Syntactic note: we should allow the moved operators to stack on top of their lambda binders (see Sauerland (1998) and also Nissenbaum's (1998) analysis of parasitic gaps.)
- ▶ Semantic note: α denotes a degree relation, and it is possible to derive the cumulative interpretation based on the denotations of α , *exactly 3*, and *exactly 2*.

Degree Operator Movement and Cumulativity

- (18) Exactly three boys kissed exactly two girls
[[_S ex. 3 [_S ex. 2 [_α λ d [λ d' [d' boys kissed d girls]]]]]]
- (19) $\llbracket S \rrbracket = 1$ iff
 $\llbracket \text{exactly } 2 \rrbracket (\lambda d. \exists d' : \llbracket \alpha \rrbracket (d)(d'))$
&
 $\llbracket \text{exactly } 3 \rrbracket (\lambda d'. \exists d : \llbracket \alpha \rrbracket (d)(d'))$

The Cumulative Operator

- ▶ To complete the implementation, all we need is a “lifted” version of a cumulative operator

$$(20) \quad \llbracket \text{CML} \rrbracket = \lambda R. \lambda Q_1. \lambda Q_2. \\ Q_1(\lambda x. \exists y : R(x)(y)) \ \& \ Q_2(\lambda y. \exists x : R(x)(y))$$

A more General Version

Non-Lexical Cumulativity: Beck and Sauerland (2000), but *cf.* Kratzer (2004)

- (21) The (two) women wanted to marry the (two) men.
- (22) Jim and Frank want to marry Sue and Amy (respectively)

A more General Version

(23) The (two) women wanted to marry the (two) men.

[the women [the men [α λx [λy [x wants to marry y]]]]]

[[the women]] = $\lambda P. P(\sigma(\text{women}))$

[[the men]] = $\lambda P. P(\sigma(\text{men}))$

[[CML]] = $\lambda R. \lambda Q_1. \lambda Q_2.$

$Q_1(\lambda X. \forall x < X \exists y \exists Y \exists Z : y < Y \ \& \ Y \in Z \ \&$
 $Z \in \min(Q_2) \ \& \ R(x)(y)) \ \&$

$Q_2(\lambda Y. \forall y < Y \exists x \exists X \exists Z : x < X \ \& \ X \in Z \ \&$
 $Z \in \min(Q_1) \ \& \ R(x)(y))$

$P \in \min(Q) \leftrightarrow P \in Q \ \& \ P \neq \emptyset \ \& \ \neg \exists P' \in Q : P' \subset P$

Scope Splitting

(24) You need to write at most five papers (to get promoted).

$[\text{S at most } 5 [\lambda d [\text{you need to write } d \text{ papers}]]]$

“There is no d greater than 5 such that you need to write d papers” (Hackl 2000)

- ▶ The sentence is about a minimal requirement.
- ▶ No specific papers should be written.

Scope Splitting and Cumulativity

- (25) You need to donate at most twelve books to at most five public schools (to be eligible for tax deduction).
- ▶ The sentence is about a minimal requirement.
 - ▶ No particular school should be given a particular number of books.
 - ▶ No specific books or schools mentioned in the law.

Scope Splitting and Cumulativity

- (26) You need to donate at most twelve books to at most five public schools (to be eligible for tax deduction).

[at most 5 [at most 12 [λd [$\lambda d'$ [you need [PRO to donate d books to d' schools]]]]]]

“There is no d greater than 12, such that you need to donate d books to public schools and there is no d' greater than 5, such that you need to donate books to d' public schools”.

Conclusion

- ▶ A complex syntax for cardinal DPs provides the basis for a fully compositional analysis of cumulative readings with non-increasing DPs that does not require radical maneuvers either at the syntax-semantics or the semantics-pragmatics interfaces.

THANK YOU!
